

Coverdesk

Project Logic, Architecture and Workflow

A visual guide to how cover review, complete-book review and executive approval work together.

Core principle: working details remain with the production team; leadership sees clean, decision-ready product information.

1. End-to-end publishing workflow

Every book advances through defined gates. Approval at one stage unlocks the next stage.

A returned product moves back to the responsible team with an executive note.

Nothing becomes executive-approved simply because a PDF exists. The cover must be approved, page feedback must be handled, and QC must pass in order.

2. Workspaces and access boundaries

The same application opens a different workspace based on the password. Server APIs enforce the boundary, not only the interface.

Workspace	Main purpose	Can see	Cannot see
Coverdesk Book@2026	Cover creation and client review	Cover metadata, concepts, versions, comments, approval	Bookdesk PDF review and executive controls
Bookdesk All@2026	Complete-book building and QC	Approved covers, PDFs, page comments, marks, QC	Rejected cover drafts, cover concepts and internal cover comments
Command Center Super@2026	Leadership decision	Finished product, progress, final PDF, QC summary	Production annotations, design concepts and internal working data

UI hiding improves clarity. Server authorization provides the actual security boundary.

3. Coverdesk logic

Coverdesk manages artwork from first brief through final cover approval.

- Google Sheets can mirror operational cover data and notes.
- A sheet note becomes an app comment and changes the cover status to Changes Needed.
- Approval history records approve, update and approval-removal events.

4. Bookdesk PDF review and annotations

A book builder selects an approved cover, adds a Drive PDF link and reviews the complete book page by page.

ANNOTATION TOOLBAR

Pins select their matching comment. Annotations can be hidden without deleting them.

Stored per page: comment text, resolved state, pin coordinates, drawing points, tool type, colour and line width.

5. Automatic saving and recovery

The user receives immediate save-state feedback, and unsent work remains recoverable after network interruption.

When the browser reconnects, the pending snapshot is replayed automatically.

- Saving: a request is in progress.
- Saved: the server confirmed persistence.
- Offline: work is queued locally until connectivity returns.
- Save failed: the request failed and remains queued for retry.

6. Quality control and executive decision

QC levels are sequential. A later level cannot pass until every earlier level has passed.

Open feedback blocks QC approval. Each QC decision stores the reviewer, note, status and review time. Executive decisions are append-only history records, giving management an audit trail.

7. Notifications, monitoring and data architecture

Workflow events become notifications; operational failures become monitoring events.

Data group	Examples	Why it exists
Production data	covers, PDFs, comments, pins, annotations, QC	Current working state
Audit data	cover approval and executive decision history	Permanent accountability
Notification data	event, audience, read state, product reference	Right people know what changed
Operational data	database failures, route failures, duration	Detect reliability problems

8. Reliability and automated checks

Automated checks protect the rules that matter most to the publishing workflow.

Operational monitoring complements tests by recording failures that happen in real usage. Together, tests prevent known regressions while monitoring reveals unexpected production problems.

The project in one sentence

Coverdesk controls artwork approval, Bookdesk controls complete-book quality, and the Command Center controls final business approval - all connected by protected data, automatic saving, traceable feedback and permanent decision history.
